PIPECRAFT

BUILDS PIPELINE

A voxel World Tour adventure starring your new heroine

THE MISSION

Explore the expo, qualify fictional leads, craft deals, build bridges and deliver the keynote before the event ends.

1. Executive vision

Pipecraft is a playful first-person voxel adventure inspired by block-building games. The player controls Ash, a charismatic RVP protagonist, in a fictionalised World Tour event at The O2. Everything is built from chunky, colourful blocks: expo booths, cloud sculptures, attendee characters, pathways, floating islands and the keynote arena.

The core fantasy is simple: **build pipeline like you build a world.** Find prospects, learn what they need, collect the right resources, craft a solution, close the deal and use the rewards to construct bridges into new zones. The event becomes a miniature open world with clear objectives, optional secrets and a big finale.

Design pillars

Blocky and instantly readable. Strong silhouettes, chunky geometry, saturated materials and clear landmarks.

Play, don't present. Movement, exploration, scanning, crafting, building, collecting, challenges and score.

Sales mechanics made physical. Leads become resources; matching needs crafts solutions; deals unlock new areas.

Spectacle with a finish line. The world grows as pipeline grows; the keynote is the climactic mission.

Safe and self-contained. Fictional attendees and data only; no backend, real badge scanning or CRM writes.

The 30-second pitch

"World Tour has spawned into a blocky universe. Ash needs to build pipeline before the keynote starts. Explore the expo, meet attendees, craft the right deal, bridge the gaps between islands and turn an empty event into a legendary win."

Tone: upbeat, witty, family-friendly and knowingly sales-themed. Avoid copying Minecraft characters, textures, UI, sounds or assets; use an original voxel art style and original game systems inspired by block-building adventures.

2. Art direction & visual system

The world should feel handmade, colourful and explorable. Use cube-based geometry, stepped terrain, block trees, chunky furniture, voxel crowds, pixel-like signage and oversized landmarks. Add modern event lighting—cyan and blue glow, purple shadows, magenta lounge areas and warm gold rewards—so the environment still feels like a major tech conference.

SWATCH	TOKEN	HEX	USAGE
	Arena Navy	#102347	Skyline, title screens, shadows
	World Tour Blue	#168BFF	Wayfinding, core UI, cloud blocks
	Scanner Cyan	#28D9F2	Scanner pulse, interactable targets
	Portal Purple	#7857FF	Portals, rare zones, night lighting
	Lounge Magenta	#F04BB8	Furniture, bonus objects, accents
	Deal Gold	#FFC857	Closed deals, rewards, rare loot
	Success Green	#67DFA4	Qualified leads, completed tasks

Materials and visual effects

• Terrain: grass, stone, polished event-floor blocks, glowing glass and floating platforms.
• Architecture: blocky expo booths, stacked cloud motifs, giant LED cubes, archways and voxel foliage.
• Feedback: pixel particles, block pop animations, floating score numbers and small celebratory confetti bursts.
• Lighting: bright readable daylight in the expo, dramatic purple/cyan stage lighting at the keynote, warm gold light around rewards.
• Keep visual effects restrained around the crosshair and HUD; gameplay clarity matters more than spectacle.

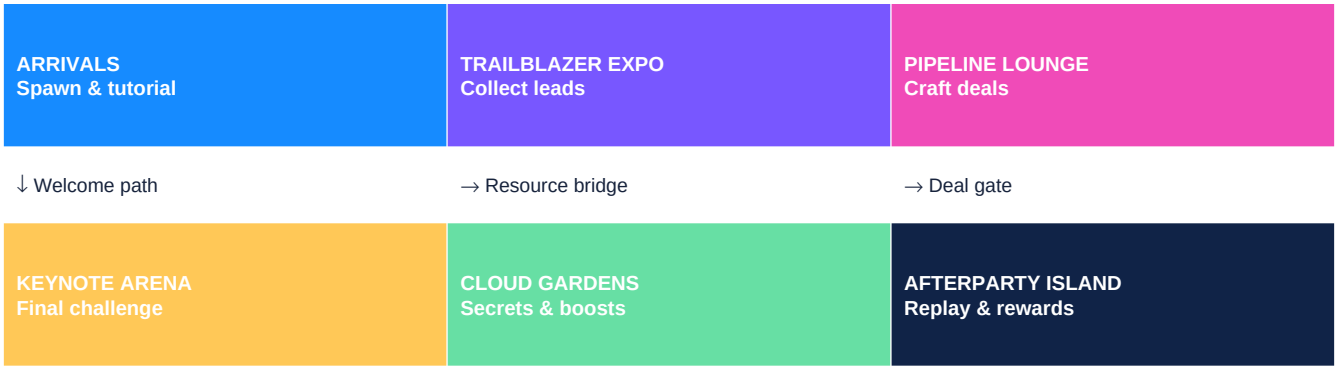

Ash character direction

Ash is a custom voxel protagonist: blocky hair and face, dark blazer, white shirt, event lanyard, practical shoes and a glowing Cloud Scanner tool. The scanner should feel like a playful multi-tool—part badge reader, part resource detector, part deal-crafting gadget. Give Ash an expressive idle animation, quick jog, jump, scan pose, deal celebration and keynote victory pose.

Character voice: short optional lines, e.g. “That’s a qualified block.”, “Pipeline doesn’t build itself.” and “Keynote time—place your bets.” Keep dialogue skippable and captioned.

3. World map & level progression

Build a compact, connected world rather than five disconnected menus. The player should see distant landmarks and understand where new bridges or portals will lead. New areas become reachable as pipeline milestones are met.

LEVEL / ZONE	PLAYER GOAL	MECHANIC / REWARD
01 — Arrivals Boulevard	Learn movement, collect 3 welcome blocks and scan a friendly attendee.	Tutorial; scanner unlock; map and objective tracker.
02 — Trailblazer Expo	Meet 5 fictional attendees and visit two demo booths.	Lead tokens, solution resources and booth challenges.
03 — Pipeline Lounge	Match attendee needs to solution blocks and close three deals.	Crafting bench; deal multipliers; bridge blocks.
04 — Keynote Arena	Gather three keynote components and build the stage access route.	Timed but forgiving finale; audience-energy meter.
05 — Cloud Gardens / Afterparty	Find secrets, optional rare lead and hidden construction route.	Golden rewards, final score, replay and sandbox roaming.

Landmarks and secrets

Use a giant glowing cloud tower visible from every zone; a central expo hall with coloured booth roofs; a suspended bridge made from earned deal blocks; a block-built O2-inspired arena silhouette; a hidden coffee mine; a rooftop networking garden; and a rare “Legendary Opportunity” chest behind an optional puzzle. Keep any real-world branding within approved use; otherwise use fictionalised event signage.

4. Core gameplay loop

Explore → spot an attendee or resource → approach → scan or interact → learn the need → collect matching solution blocks → craft a deal → earn pipeline → build a bridge or unlock a zone → prepare the keynote.

First-person controls

WASD to move; mouse to look; Space to jump; Shift to sprint; E to interact; left-click to scan/use the Cloud Scanner; Tab to view the map; Esc to pause. Show controls on the title screen and as a small reminder during the first level. Include adjustable mouse sensitivity and a non-timed relaxed mode.

Scan and qualify

Attendees are friendly voxel NPCs with fictional names and visible need icons. Aim at an attendee and scan within range. A scan reveals a simple need, such as “connect customer data,” “speed up service” or “help sellers prepare.” Successful scans award Lead Blocks; scanning alone is not always enough to close the deal.

Craft a deal

Collect solution resources from demo pods—Data Cubes, AI Sparks, Service Bricks and Trust Tokens. At a crafting bench, combine the right resources for the attendee’s need. A correct combination creates a Deal Block, increases the pipeline meter and opens new routes. A wrong combination should cost a little time or score, never block progression.

Build the world

Let players place a limited number of earned bridge blocks on highlighted build sockets to connect platforms, open shortcuts or construct stage access. Keep free-form building out of the MVP; guided construction gives a satisfying block-building feel while keeping navigation and collision reliable.

Power-ups

Coffee Rocket: temporary sprint; Signal Beacon: longer scan range; Golden Lanyard: bonus deal value; Crowd Freeze: slows nearby NPC movement for a short period; Cloud Jump: higher jump. Use clear icons and timed status indicators.

Fail-forward rule

Missing a timer, choosing the wrong solution or falling into a safe reset zone should never end the run. Return the player to a nearby checkpoint, preserve collected progress where possible and use a humorous message to keep the experience light.

5. HUD, objectives and reward design

HUD should feel like a polished voxel game overlay. Keep it compact and high contrast, with a crosshair and context prompt rather than business-dashboard panels.

ELEMENT	BEHAVIOUR
Top-left mission	Current objective, e.g. “Qualify 3 more attendees” and progress ticks.
Top-right pipeline	Pipeline total, closed deals and current streak.
Centre reticle	Changes shape when a block, attendee or station can be interacted with.
Bottom-left tool	Cloud Scanner status, cooldown and “E to scan” prompt.
Bottom-right minimap	Simple top-down zone map, player arrow, objectives and locked gates.
Feedback toast	“LEAD QUALIFIED!”, “DEAL CRAFTED!” or “BRIDGE BUILT!” with particles and short sound.

Scoring model

ACTION	BASE SCORE	BONUS
Qualify an attendee	+100	+50 for correct need discovery
Craft a deal	+300	Deal streak increases multiplier
Build a bridge / shortcut	+150	Unlock a new route
Find a secret chest	+200	Rare collectible stamp
Complete the keynote	+500	Bonus based on audience energy

End screen

Show total score, pipeline value, leads qualified, deals crafted, secrets found, keynote rating and medal tier. Provide Replay, Explore Freely and Return to Title. Store best score locally only if desired, with a clear reset option.

Accessibility and comfort

Offer reduced-flash effects, captions for all dialogue, sensitivity controls, readable objective text, icons plus colour for target types, pause-on-tab-blur and relaxed mode without a countdown. Avoid rapid camera shake or forced motion effects.

6. Technical build specification

Primary deliverable: one self-contained **pipecraft.html** file that opens locally in a modern desktop browser, without a server, account, build step, backend or external network dependency. Inline CSS and JavaScript. If using a 3D engine, bundle it locally or embed it so the final file works offline; do not rely on a CDN for core gameplay.

AREA	REQUIREMENT
Rendering	WebGL voxel world using Three.js or a lightweight equivalent; use instanced cubes or merged geometry to keep draw calls manageable.
World	One connected map, modular block palette, five zones, landmarks, collision boundaries and safe respawn points.
Camera	First-person view, mouse look and pointer lock where supported; clear fallback and pause behaviour.
Interactions	Raycast or forward target check for scanning, resource pickup, crafting stations and build sockets.
NPCs	Simple voxel NPCs with idle/walk behaviours, short dialogue cards and fictional needs; avoid expensive crowd simulation.
State	Local in-memory game state; optional localStorage best score only. No telemetry or external calls.
Performance	Target smooth play on a recent laptop. Limit particles, reuse materials, cap crowd count and adapt detail if frame rate drops.
Robustness	Handle resize, pause on blur, prevent falling through geometry, reset broken states and show a WebGL fallback message.
Privacy	All names, badges, needs and deals are fictional. No camera, microphone, real badge data, CRM writes or network requests.

MVP scope versus stretch

MVP — MUST SHIP	STRETCH — ONLY AFTER MVP
• First-person movement, jump, sprint and collision • Original voxel environment and Ash character treatment • Five themed zones in one connected map • Fictional NPCs, scan/qualify loop and need matching • Resource collection and deal crafting • Guided bridge construction • One power-up, one secret and a keynote finale • HUD, pause, results and replay • Single-file offline HTML	• Free-form block building • Voice acting / lip-sync • Advanced crowd AI • Multiple event days or worlds • Controller support • Dynamic weather and day/night • Elaborate cutscenes and complex shadows • Local leaderboard across multiple profiles

7. Acceptance criteria and QA

TEST	PASS CONDITION
Launch	Opening pipecraft.html displays the title screen without setup or network access.
Controls	WASD, mouse look, jump, sprint, interact, pause and restart work.
Navigation	Player collides with solid structures and cannot fall through the map; safe reset points exist.
Scan loop	Visible in-range fictional attendees can be scanned; out-of-range targets cannot.
Need matching	At least three different needs and solution combinations are implemented with clear feedback.
Crafting	Correct resource combinations create deals and update score/pipeline.
Construction	Earned blocks can be placed on marked build sockets to open a route.
Progression	All five zones can be reached; objectives and unlocks update reliably.
Finale	Keynote cues can be collected and the finale completed; missing the timer never soft-locks.
Score	Score, pipeline, secrets and completion state display correctly on results screen.
Accessibility	Reduced flash, readable prompts, captions/text equivalents and sensitivity setting are available.
Offline	Core game runs without external requests; no real user data is collected.
Stability	No fatal console errors during a full playthrough; restart returns to a clean state.

Definition of done

A player can open one HTML file, learn the controls, explore a colourful voxel World Tour, qualify attendees, craft at least three deals, build a route, reach and complete the keynote, see a score and replay. The game should feel complete over a 5–10 minute session and be fun to explore beyond the critical path.

Brand and originality note

Use an original voxel aesthetic rather than copying Minecraft textures, characters, sounds or interface. Use official logos and trademarks only where approved; otherwise use stylised fictional equivalents. The World Tour environment is a playful, fictionalised homage, not an official event simulation.

8. Build plan and change request

Recommended build milestones

Milestone 1 — Walkable voxel world. Create the terrain, connected zones, first-person controls, collisions and Ash's first-person tool.

Milestone 2 — Pipeline loop. Implement fictional NPCs, scanner, lead resources, needs and objective tracking.

Milestone 3 — Craft and build. Add solution resource collection, deal crafting, scoring, bridge sockets and unlockable routes.

Milestone 4 — World Tour spectacle. Polish voxel art, lighting, booth variety, landmarks, particles, power-ups and secrets.

Milestone 5 — Keynote and QA. Add finale, results screen, accessibility options, offline verification and full-playthrough testing.

Change request summary

Request: Build Pipecraft: Ash Builds Pipeline, an original, Minecraft-inspired voxel browser adventure starring Ash at a fictionalised World Tour event. Deliver it as a self-contained HTML file that runs locally. The core gameplay combines first-person exploration, attendee scanning, resource collection, solution crafting, guided block-building, progression across five connected zones and a keynote finale. The game must be safe for work, fictional-data-only, accessible enough for a short demo and robust enough for a complete 5–10 minute playthrough.

Primary success measure

The experience demonstrates that a browser can host a genuinely playable, stylised 3D game—not just a visual mock-up—with a recognisable protagonist, meaningful gameplay, world progression, a clear finish line and a replayable score.

End of brief • Pipecraft: Ash Builds Pipeline
